The start-up time operation seemed to be producing more carbon dioxide than operation under load when the system has reached the desired temperature. Table 3 summarizes the averaged data point for the four units ranging from 4800 to 5300 ppm CO. However, carbon monoxide formation and release was only found 2 during the start up 20 min, which was on average from 20 to 80 ppm, see figure 4c and 4d. Note each of the Micro-GC took sample in every three minute so that the data shown in table 3 may not represent a constant release of carbon monoxide at such level. The second Micro-GC, expected to perform very closely but not identically, played a compensating role to provide an average sampling at one and a half minute interval and we observed no unexpected results. Methanol and methane were only found during the start up time, along with carbon monoxide. However, in all cases the emission levels measured with the micro-GC were mostly below the...
